Abstract. Thinking cannot develop successfully without linguistic material. Enriching speech has a positive influence on the development of thinking. It is important that the new language means that assimilates schoolboy filled with real meaning. It enables communication of thought and speech. This article deals with the problem of development of coherent speech and writing skills of students, described the methodological aspects of the organization of work on the development of coherent speech of younger students in the classroom reading and language, games, dramatization provide mastery of such qualities of speech, as the correctness of speech, its cleanliness, accuracy, consistency, expressiveness, imagery, accessibility, efficiency and relevance.

Key words: development of coherent speech, younger students, exercises.

Modern school pays much attention to the development of thinking in the learning process. Thinking cannot develop successfully without linguistic material. In logical thinking important role belongs to the concepts, which summarizes the essential features of phenomena. Concepts denoted by words, hence the concept of the word finds necessary for communication material shell.

Human thought is clothed in language forms. No matter how difficult the content of human thought, it is slender embodiment of the syntax and morphological forms of language.

Enriching speech in turn has a positive influence on the development of thinking. It is important that the new language means that assimilates schoolboy filled with real meaning. It enables communication of thought and speech.

In the narrow linguistic sense of speech – this ownership language rules (in pronunciation, word stress, word usage in the construction of phrases and the like), as well as the ability to use expressive means of language in different contexts of communication in accordance with the purpose and content of the speech but in a broader sense – that reading culture, and an important part of human culture.

The word "culture" (from the Latin culture) literally means "cultivation", "development". This is what "processed", "cultivated" and handed down to us by our predecessors inherited; is that "processed" and "cultivated", polished us to pass to the next generation. (Ivanova, 1970, pp.4-5)

Of speech – a branch of linguistics, which deals with two issues: how to speak properly and how to speak well. This is a relatively young field of linguistics emerged as an independent discipline after the revolution under the influence of social changes that have occurred in our country.

Of speech occupies in the school course of Russian language is the same position as the style – it is an aspect of teaching all sections of the science of language included in the school curriculum. These two traditional schools in the direction of the development of speech students reflect something other than the basic problem of speech culture. (Lvov, 1995, p.18)

Development of coherent speech is the central task of cultivating the culture of students’ speech.

The content of education at the present stage is characterized by increased attention to the problem of development of coherent speech and writing students. These students had limited vocabulary, difficulty coherent expression and communication. These students have difficulties in all academic subjects from the early days of training. Of all the knowledge and skills of the most important, most necessary for vital activity is the ability to clear, clear, nice to speak their language. Throughout his life, a person perfects it, possessed a wealth of language. The more fully digested richness of language, the freer people use them, the better he knows the complex linkages in nature and society. For a child a sufficient level of speech development is the
key to successful learning. Lessons in reading and language, games and dramatization provide mastery of such qualities of speech, as the correctness of speech, its cleanliness, accuracy, consistency, expressiveness, imagery, accessibility, efficiency and relevance.

Speech development of younger schoolchildren should be based on a coherent system of work. On native language lessons and reading, we often encounter with the answers in poor lexical relation. A poor vocabulary combined with poor syntax. Meager vocabulary younger schoolboy often inhibited and successful work on spelling. Therefore, MR Lions recommends their benefits younger students develop speech on levels:

Phonetic level involves working on the production of speech sounds, articulating above, differentiation of sounds and letters.

At the lexical level is conducted dictionary work on it 4 areas: quantitative enrichment dictionary; refinement dictionary, activation dictionary, elimination of non-literary words (Lvov, 1995, p.13).

At the syntactic level, work on two major units of syntax – the phrase and sentence. These include creative exercises, building offers specified type, reducing common proposal and dissemination of simple sentences, etc. The last level is work on connected speech. In the process of improving the speech training of students, respectively, the levels of development of speech used general methods: observation, comparison, work on concepts, establish the temporal sequence of cause-and-effect relationships.

But at every level of the teacher has special methods of work. So, we should not forget that the sound side – belonging speech – is not only a mandatory form of its material existence, but one of the important factors in its expressiveness. The same in content and structure it can be pronounced differently. From sound design depends emotional speech, her ability to have some impact on the audience. Therefore, the work to build a culture of speech of younger students as a compulsory element includes work on the sound side of speech.

Scheduling form work on the sound side of speech, it is necessary to proceed from the qualities that characterize the correct and good speech. Data quality, quirky sound refracted in her side, determine the content of the work on the sound side of speech, where you can talk about two major directions in this work:

– building skills phonetically correct speech;
– building skills phonetically good speech.

In terms of the formation of correct speech phonetically main task is to eliminate the shortcomings that hamper semantic aspects of speech perception. Leading place here belongs to work on mastering intonation and norms of the literary language.

In terms of building a good speech phonetically task is to educate the younger students overall articulatory -aural culture, skills, fluency in all audio assets in different types of speech activity (dialogical and monological speech, expressive reading, etc.).

As you know, articulation and intonation skills children develop on the basis of imitation speech of others. The degree of absorption of sound and proper means of language depends on the development of the child hearing the speech, which refers to not only the psychological ability to perceive all sound means of language, but also the ability to reproduce them in their own language.

As you know, articulation and intonation skills children develop on the basis of imitation speech of others. The degree of absorption of sound and proper means of language depends on the development of the child hearing the speech, which refers to not only the psychological ability to perceive all sound means of language, but also the ability to reproduce them in their own language. Thus, the work of speech involves the formation of students' skills, which can be conditionally divided into two groups:

Auditory skills is the ability to fix attention on the sound side of the question, analyze and evaluate it in terms of correctness, expressiveness, euphony and other qualities, the ability to accurately and completely tone catch, to perceive the thoughts and feelings of the speaker and the reader.

Articulatory skill is the pronunciation in the broadest sense. These two kinds of skills are closely related to each other and suggesting formed on the native language lessons in connection with work on individual units of speech sound. Linguistic specificity of these latter, on the one hand, and the problem of working on the speech sound of children side – on the other, make it possible to allocate the audio training speech unit. The smallest unit of sound speech training is phonetic word, which are formed on the basis of the most important articulation and pronunciation skills. As a unit of speech training phonetic word like "absorbs" smaller units of speech sound – the sound and syllable.
Next speech training unit is phrase. On the basis of such phrases produced quality sounding speech as harmony, intonation accuracy, richness and expressiveness.

The largest unit is the text of speech training with intonation unity of its constituent phrases, as well as the general tone, tempo, volume, pronunciation as a means of logical and emotional expressiveness. Tempo and loudness of pronunciation is provided and speech quality as relevance.

Work on each subsequent unit includes the formation of skills associated with the previous unit. So, based on the phrase, work continues on pronouncing skill, as well as working with text and assimilation provides phrasal intonation.

So education articulatory – auditory culture suggests two sides: the formation of auditory skills and articulatory – forming abilities of pronunciation. In accordance with this exercise may be arbitrarily divided into the following two types:

Exercises designed to develop auditory culture;

Exercises aimed at development of pronunciation (in the broadest sense of the word) culture.

Exercises of the first type are mostly analytical, because the performance of their transition from direct, undifferentiated perception of speech sound stream to its dismemberment and evaluation. This analysis external aspect of speech is based on theoretical knowledge of phonetics and syntax.

Exercise of the second type are predominantly syntactic in nature, because they suggest the mobilization of all phonetic knowledge and skills to design external aspects of speech.

The relationship between these two types of exercise is obvious: education articulatory culture is possible only in reliance on auditory skills, and vice versa, so often exercises are mixed analytical-syntactic character.

Exercises to develop external aspects of speech are extremely varied and can be organized in different ways. We believe the most appropriate seems to systematize such exercises, in which the starting point is taken unity speech training. Show the main varieties of such exercises.

1. Exercise analytical type, developing the ability to aurally perceive, analyze and evaluate the sound side of the readable text:
   a) How many proposals to listen? How to define the boundaries between hearing suggestions?
   b) What are the words in the text are highlighted logical stress and why?
   c) Listen to the poem (or prose passage ) while reading his book by himself . Especially as intonation, which reads this work, passed on a letter (paragraphs, punctuation)?

2. Exercise analytical and synthetic type, directly aimed at developing expressive reading of the text:
   a) Read this story himself. Compare the pronunciation of the word ball throughout the story. What does it depend on? Why only in the first sentence, the word is pronounced with a logical stress? What words should fall logical stress in the following sentences and why? Read the story aloud, observing the logical stress.

Written composition in 1 class precede various teaching oral exercises: drafting proposals under the theme, text strain recovery Series scene pictures, oral answers, united by the theme, oral stories they read on, by analogy with the read. By performing these exercises, students learn under the guidance of teachers express thoughts in order, sequentially (Golovin, 1956 , p. 33). Works graders – is collectively made up stories about games, amusements, and working on them, students learn to interpret their activities.

Extremely large role in the development of painting coherent speech of pupils. Painting affects the child's feelings, opens up those aspects of life that he could not face in their immediate experience. Painting helps more aware of the phenomena that are already familiar schoolboy. It facilitates knowledge he lives.

The schools used the training pattern. They are available to students, suitable for use in the classroom, but not always expressive enough. Therefore, for the development of coherent speech should use art paintings (Zaporozhets, 2003, p. 39). Paintings develop observation, imagination students are taught to understand the art of painting.

First works on one picture and must be preceded by oral conversation. Description of the picture – the most difficult form of essays. Usually it is held in high school, but is allowed in the 4th grade (picture elements of the description may be in the 2 to 3 classes).

At the elementary school children describe the picture on the issues identified, first, theme paintings (what it displays), and secondly, its composition, foreground, background, location of objects. Third, actors, action, if any. Finally, the ideological meaning, "mood"
Already in the 2nd class practiced oral description pictures ("Tell me what you see in the picture"). From grade to grade requirements to describe complicated pattern, introduced elements of analysis, observation develops children.

Observation is very important for the development of coherent speech. The school organizes a system of observations of nature, individual objects and processes. Oral histories and written essays summarize, organize observations. Stories Observations size larger, because the children a lot of stuff. A sequence, completeness descriptions provided preparatory conversation.

In the development of speech laborious work of pupils and teachers. Systematic development of speech is necessarily leads to success.

Developing coherent speech students, we plant a number of specific skills. Emphasize the same skills that directly relate to the level of the text: first, the ability to understand and interpret the theme, select it, find boundaries, and secondly, the ability to gather material, select what is important and discard secondary and thirdly, the ability to have material in the correct sequence, to build a story or essay on the plan, and fourthly, the ability to use language means in accordance with published standards and objectives statements, as well as fix, improve, improve writing.

Connectivity as one of the most significant signs of categorical text characterized the interaction of several factors: the content of the text, its meaning, logic of presentation, a special organization of linguistic resources; communicative orientation, the composite structure.

Identified features of connected utterances of children depending on the nature of visual material and communicative situation, determine the most effective instructional techniques formation of coherence, selected situations in which increasingly provided development, or connectivity, children's compositional completeness statements.

Retellings illustrations more meaningful, structural feature, are more fullness sequence. Children play almost all the highlights tales, as they clearly shown in the illustrations.

Thus, the simultaneous use of literary and sample pictures positively affects the content and connectivity retellings, their volume, fluency, increased motivation and self-expression. However, in some cases, increased levels of situational speech, when children are more focused on the image, replace the transfer retelling depicted characters.

Limitations of verbal communication, aborted coherent speech adversely affect the child's identity, cause specific neurotic layering, form negative traits (isolation, negativity, aggression, insecurity, feelings of inferiority), which affects the performance, but also on the social activity of the child.

Thus, these arguments demonstrate the need for special pedagogical work phase focused on the development of all levels of speech and of the individual student as a whole.
